No.	Settings	Description	Default Value	Optimisation [1]	Suggested optimisation settings			Remark	[SnR = SnR = Support and Resists DO = Drawdown]			
					Start	Step	Stop		Pts = Points	TF = Timeframe	BE = Breakeven	TSL = Trailing Stop
7.03	BUY - Max AI confidence (3.5 = 350%)	Mathematically, the exponential term for AI increase result settings (above) will explode if there are more and more trades opening. When the Buy Result overly huge and become not reasonable, then DV7 will never open any buy trade. Hence, we use Max AI confidence to cap the maximum Buy Result. ZZZ value. Mean, the maximum Buy Result ZZZ is only 3.5 (350% confidence level), by default, regardless how many trades opening.  AI entering trade based on % of "confidence" level in the current market trend. Refer to the dashboard comment at the top left, AI will sell when (Result: ____ < Sell Result: ____)  Take note the dashboard comment number at the Sell Result: ____ (XXX)YYY (TRUE/FALSE) = ZZZ  XXX is the initial confidence level. If it is showing XXX as 1.28, it mean the AI need to be 128% confidence to sell in order to execute the sell trade. ZZZ is the final confidence level after increase by the < Sell-Increase Result > below.  In short, you can refer to the (TRUE/FALSE) to know whenever it hit sell entry condition or not. > If you want to make the AI less sensitive and only trade on very large confidence level, you can put a positive number, eg -1.0 (mean 100% more confidence only enter). Following example above, initially is 128%, with additional 100% here, AI will only sell when have (128 + 100 = 228%) confidence. > If you want to make the AI more sensitive and just trade even just small chance (more frequent entry), you can put a negative number, eg -1.0 (mean 100% less confidence). Following example above, initially is 128%, with minus 100% here, AI will sell when have (128 - 100 = 28%) confidence.  This is the exponential term of AI entry confidence for sell direction. When more and more trades opening, you want to constraint the AI so that it won't keep opening trade especially when market is hugely against us. Hence AI entry confidence can be increase when there are more trades opening.  Take note the dashboard comment number at the Sell Result: ____ (XXX)YYY (TRUE/FALSE) = ZZZ	3.5	No								
7.04	SELL - Adjust X times more(+/-)less(-) Result_SD signal	YYY represent this value. By default is 1.1, mean if XXX is 1.28 and YYY is 1.1, when 0 sell trade opening = Sell Result = 1.28*(1.1^0) = 1.28 1 sell trade opening = Sell Result = 1.28*(1.1^1) = 1.41 2 sell trade opening = Sell Result = 1.28*(1.1^2) = 1.70 3 sell trade opening = Sell Result = 1.28*(1.1^3) = 1.87  As you can see, the confidence level keep increasing when more sell trades is opening. In other word, AI become more conservative as more trades is opening (aka play more safe). A higher value will increase the sell result even faster, and make AI trade even more safe for the next trade, and only enter when it is hugely confidence.  <b>Note:</b> This is only applicable for Multi entry trade style.  Mathematically, the exponential term for AI increase result settings (above) will explode if there are more and more trades opening. When the Sell Result overly huge and become not reasonable, then DV7 will never open any sell trade. Hence, we use Max AI confidence to cap the maximum Sell Result. ZZZ value. Mean, the maximum Sell Result ZZZ is only 3.5 (350% confidence level), by default, regardless how many trades opening. Instead u change < BUY and SELL Adjust > 1 by 1, when TRUE, the SELL Adjust setting automatically equal to BUY Adjust setting. Making both < BUY and SELL Adjust > always the same. This can ease the process of optimisation, as you only need to change the BUY side. Instead u change < BUY and SELL Increase > 1 by 1, when TRUE, the SELL Increase setting automatically equal to BUY Increase setting. Making both < BUY and SELL Increase > always the same. This can ease the process of optimisation, as you only need to change the BUY side. Instead u change < BUY and SELL Max AI Confidence > 1 by 1, when TRUE, the SELL Max AI Confidence setting automatically equal to BUY Max AI Confidence setting. Making both < BUY and SELL Max AI Confidence > always the same. This can ease the process of optimisation, as you only need to change the BUY side.	0	Yes	0	0.2	1					
7.05	SELL - Increase Result_SD signal by (10% = default) when more trade opened	YYY represent this value. By default is 1.1, mean if XXX is 1.28 and YYY is 1.1, when 0 sell trade opening = Sell Result = 1.28*(1.1^0) = 1.28 1 sell trade opening = Sell Result = 1.28*(1.1^1) = 1.41 2 sell trade opening = Sell Result = 1.28*(1.1^2) = 1.70 3 sell trade opening = Sell Result = 1.28*(1.1^3) = 1.87  As you can see, the confidence level keep increasing when more sell trades is opening. In other word, AI become more conservative as more trades is opening (aka play more safe). A higher value will increase the sell result even faster, and make AI trade even more safe for the next trade, and only enter when it is hugely confidence.  <b>Note:</b> This is only applicable for Multi entry trade style.  Mathematically, the exponential term for AI increase result settings (above) will explode if there are more and more trades opening. When the Sell Result overly huge and become not reasonable, then DV7 will never open any sell trade. Hence, we use Max AI confidence to cap the maximum Sell Result. ZZZ value. Mean, the maximum Sell Result ZZZ is only 3.5 (350% confidence level), by default, regardless how many trades opening. Instead u change < BUY and SELL Adjust > 1 by 1, when TRUE, the SELL Adjust setting automatically equal to BUY Adjust setting. Making both < BUY and SELL Adjust > always the same. This can ease the process of optimisation, as you only need to change the BUY side. Instead u change < BUY and SELL Increase > 1 by 1, when TRUE, the SELL Increase setting automatically equal to BUY Increase setting. Making both < BUY and SELL Increase > always the same. This can ease the process of optimisation, as you only need to change the BUY side. Instead u change < BUY and SELL Max AI Confidence > 1 by 1, when TRUE, the SELL Max AI Confidence setting automatically equal to BUY Max AI Confidence setting. Making both < BUY and SELL Max AI Confidence > always the same. This can ease the process of optimisation, as you only need to change the BUY side.	1.1	Optional	1	0.1	1.5	Only need to optimise when using Multi Entry Type				
7.06	SELL- Max AI confidence (3.5 = 350%)	Mathematically, the exponential term for AI increase result settings (above) will explode if there are more and more trades opening. When the Sell Result overly huge and become not reasonable, then DV7 will never open any sell trade. Hence, we use Max AI confidence to cap the maximum Sell Result. ZZZ value. Mean, the maximum Sell Result ZZZ is only 3.5 (350% confidence level), by default, regardless how many trades opening. Instead u change < BUY and SELL Adjust > 1 by 1, when TRUE, the SELL Adjust setting automatically equal to BUY Adjust setting. Making both < BUY and SELL Adjust > always the same. This can ease the process of optimisation, as you only need to change the BUY side. Instead u change < BUY and SELL Increase > 1 by 1, when TRUE, the SELL Increase setting automatically equal to BUY Increase setting. Making both < BUY and SELL Increase > always the same. This can ease the process of optimisation, as you only need to change the BUY side. Instead u change < BUY and SELL Max AI Confidence > 1 by 1, when TRUE, the SELL Max AI Confidence setting automatically equal to BUY Max AI Confidence setting. Making both < BUY and SELL Max AI Confidence > always the same. This can ease the process of optimisation, as you only need to change the BUY side.	3.5	No								
7.07	Force BUY Adjust = SELL Adjust	Instead u change < BUY and SELL Adjust > 1 by 1, when TRUE, the SELL Adjust setting automatically equal to BUY Adjust setting. Making both < BUY and SELL Adjust > always the same. This can ease the process of optimisation, as you only need to change the BUY side.	TRUE	No								
7.08	Force BUY Increase = SELL Increase	Instead u change < BUY and SELL Increase > 1 by 1, when TRUE, the SELL Increase setting automatically equal to BUY Increase setting. Making both < BUY and SELL Increase > always the same. This can ease the process of optimisation, as you only need to change the BUY side.	TRUE	No								
7.09	Force BUY Max = SELL Max	Instead u change < BUY and SELL Max AI Confidence > 1 by 1, when TRUE, the SELL Max AI Confidence setting automatically equal to BUY Max AI Confidence setting. Making both < BUY and SELL Max AI Confidence > always the same. This can ease the process of optimisation, as you only need to change the BUY side.	TRUE	No								
8		Entry Delay Filter (Volatile / Low TF)										
8.01	AI Entry Signal Delay	How many < entry signal > you want DV7 to ignore before entering the next trades.  If you set to <-1> DV7 will just enter any trade as long as it fulfilled the entry criteria (like normal). If you set to <-3> DV7 will ignore the first 3 entry signal. DV7 will only place the trade at the 4th signal.  The purpose is to delay the entry signal a bit to take advantage of potential "Divergence" signal in the market. Meaning, it allow DV7 potentially capturing any slow down of momentum in the price movement. This signal a greater opportunity to enter and potentially more accurate entry. Since is more accurate, then you can risk more on the next following trade. How many < minute delay > you want DV7 to wait before re-analyse the market.  If you set to <-1> DV7 will continuously check for entry signal and enter trade on every candlestick (like normal). If you set to <-3> after DV7 check for the entry signal on current candlestick and potentially entered any trade, it will wait for 3 more minute, then only re-check again for new entry signal. If you set to <-10> after DV7 check for the entry signal on current candlestick and potentially entered any trade, it will wait for 10 more minute, then re-check again for new entry signal.	-1	Optional	-1	1	6					
8.02	Minute entry delay	The purpose is to delay the entry signal a bit to avoid overly aggressive entering the trade again and again on all candlestick. Suitable when wanting DV7 to enter trade on lower TF signal, but remain trade less frequent. For example, signal on M5, but only trade once per hour. Hence, you can set to 60 and only recheck the entry signal every (60 * M1 = 60mins).  <b>Note:</b> MT4 backtest result will slightly different compare to live when using this setting. The reason is MT4 backtest engine will have slippage issues (price is not 100% connected between open and close price). Unlike live market, the data come in every second (or even milliseconds) which is nearly impossible to do it on backtesting. Hence, when using this, better observe the EA in visual mode again whenever the trade behaviour fit your expected outcome. When using in live, do observe 1-2 weeks to see how does it perform and does it still perform like what u expect?	-1	Optional	-1	5	60					
9		AI Indicators										
9.01	Number of bars to measure trend (eg)	DV7 3rd indicator is "ReReg" which is designed to analyse the "chart pattern" of the current market. By default, it consider past 50 candlesticks as reference to find the recognise any potential market "pattern".  A larger number will consider bigger "pattern" which potentially result in larger trend in the future. When FALSE DV7 will learn to buy when market is at trough (downtrend) and sell when market at peak (uptrend). When TRUE, DV7 will do the opposite where it will learn to buy when market is raising (uptrend) and sell when market at dropping (downtrend).	50	Optional	25	25	150	Refer 4.02				
9.02	Reverse RSI Min Max in AI logic	Logic: When RSI >= RSI Min = Buy RSI <= RSI Max = Sell  Ps: Value is not "fixed" AI will make little adjustment on RSI min max as well	FALSE	No				BETA - Still Testing				
10		Time Filter for Entry										
10.01	Basic Time Filter on entry	This allow you to set the trading period (time within a day).  If TRUE, the EA will only trade between the specified time (below). The EA will automatically disabled when outside of the time. If trades are still open when is outside of trading period, it will remain open, until close by BE / TP / Manually. You may key in specific start and end trade time to constraint EA only trade on specific trading session (Asia, Europe, or US)  If FALSE it will trade continuously whenever the market is opening.  <b>Note: It is highly recommended to place DV7 outside of "trading time" but weekday. For example, broker time 0300 Monday. This allow 30 mins buffer time for DV7 AI to learn the current market.</b>	TRUE	No								
10.02	After this hour Start trade	The starting hour where EA can start to do trading based on broker server time - visible at the top of the Market Watch section	3	No								
10.03	After this minute Start trade	The starting minute where EA can start to do trading based on broker server time - visible at the top of the Market Watch section Combine with above it mean, EA only trade when broker time > 03.30 By default, this is to avoid EA trade when market is closing where the market is less volatile	30	No								
10.04	After this hour End trade	The ending hour where EA will stop do trading based on broker server time - visible at the top of the Market Watch section	23	No								
10.05	After this minute End trade	The ending minute where EA will stop do trading based on broker server time - visible at the top of the Market Watch section Combine with above it mean, EA only trade when broker time < 23.30 By default, this is to avoid EA trade when market is closing where the spread is significantly higher	0	No								
11		Max Spread for Entry										
11.01	Max spread for entry signal	EA will only trade is the spread is lower that the input value (in points). This help to avoid entering trade when market is extremely volatile and spread is huge (high cost). By default value is very large (999999) this mean DV7 will just enter trade at any spread.	999999	No								
12		Risk Management / Position Sizing Settings										

No.	Settings	Description	Default Value	Optimisation [1]	Suggested optimisation settings			Remark	[SnR = SnR = Support and Resists DO = Drawdown			
					Start	Step	Stop		Pts = Points	TF = Timeframe	BE = Breakeven	TSL = Trailing Stop
15.07	Exit ALL trades on opposite signal	<p>Some time entry signal of the opposite direction will be a good signal to exit. For example, you are having BUY trades and now Sell signal come in. You can either</p> <p>1. Remain the BUY trades and enter the SELL trade</p> <p>2. Exit BUY trades 1st then only enter SELL trade</p> <p>Approach 1 is used for hedging purpose where BUY and SELL are open together suitable for both Multi and Single entry style. While 2nd approach is suitable for single entry where it force to have only 1 direction trade (and likely force to 1 trade at a time).</p> <p>When <b>TRUE</b>, ALL of the trades of the opposite direction will be close 100% (ignoring min close profit and SD Upper or Lower constraint). This trade may close in loss (cut lose fast), but also allowing the upcoming can enter without worry about previous trade (follow the trend).</p> <p><b>Note:</b> When using minute entry delay, this may get conflict. For example, if EA set to have 60 minutes delay between each entry, currently having Sell trade opening. However, 1minis later, opposite Buy signal come in and it will close the Sell trade. EA still wait for the next 50minutes to complete before allow to enter Buy trade on this Buy Signal. And this Buy signal may also change after 59 minute. This will result in Sell trade close too early (maybe result in spread loss) yet still not able to enter opposite direction trade.</p>	FALSE	No								
16		Breakeven Stops (BE) Settings										
16.01	Use Break Even ?	<p>Do you want to put BE after partially closed the trade? If <b>TRUE</b>, Breakeven SL will apply when price move 50pts (default) in your favour.</p> <p><b>Note:</b> The BE is placed above buy average price, or below average sell price. Hence if you have multiple trades opening, the BE will result in some trade in losing, some in profit. But overall you are breakeven.</p> <p><b>Note:</b> This can be overwrite by &lt;Progressive BE&gt; settings below</p>	FALSE	No								
16.02	Profit during BE In points	<p>When placing BE SL, what is the minimum profit in points for the BE. By default, a 10 points of profit will be secured after closing the trade partially.</p> <p>When close trade signal triggered and trade is closed partially, a BE will place at 25% from the entry price. For example, a buy trade entered at 1USD and have exit signal at 2USD. The distance in between is 1.00USD, hence, the progressive BE (aka a SL) will placed at</p>	10	No								
16.03	Progressive BE in %	<p>BE price = Entry price + Distance between entry &amp; exit price * BE Progressive + 1.00USD * (1.00USD * 0.25) = 1.25 USD (BE SLwill placed here).</p> <p>This is act like "auto" trailing stop, as the exit signal close the buy trade higher and higher, it also shift the BE SL higher. BE Progressive is more preferable as it is more robust (automatically decide based on distance).</p> <p><b>Note:</b> Although &lt;Use Break Even&gt; is FALSE, as long as progressive BE value is not 0, it will still use it.</p> <p><b>Note:</b> If set &lt;0&gt;, progressive BE will not be use.</p>	0.25	Optional	0.25	0.25	1 [5]					
17		Proprietary (Prop) Trading Firm Risk Settings										
17.01	Use for Prop Trading Firm ?	<p>If you want to take the EA to trade at prop firm OR you just want to better control on the risk, you can change this to <b>TRUE</b> by apply prop firm trading rules (below).</p> <p><b>Note:</b> Because you are forcing EA to have strict rules on the risk management to fulfill the prop firm risk parameter, optimisation on key inputs is required to maintain it's consistency.</p>	FALSE	No								
17.02	Stop trading after XX% PROFIT per day (min Profit %)	<p>All prop firm have a profit target to reach in the evaluation. When you reached the target, you basically passed, and all you need is just to wait for the account being verified. Hence, by default, when the EA managed to get 10% ROI today, it will stop to do trading immediately, and just let the current trade continue going.</p>	10	No								
17.03	Close and Stop trading after XX% LOSE per day	<p>The most challenging part of prop firm is risk control. Here you can set maximum daily DD of the robot. By default, when EA have open trades and is losing to 4.5%, it will immediately close all the trades and wait until the next day.</p> <p><b>Note:</b> It is recommended not to put too close on this daily DD limit, because when market very volatile, it may make the robot not have enough time to close at exactly 5% DD, hence you accidentally violate the rule.</p> <p>The most challenging part of prop firm is risk control. Here you can set maximum daily USD amount loss of the robot. By default, when EA have open trades and is losing to net daily losses of -999,999 USD, it will immediately close all the trades and wait until the next day.</p>	4.5	No								
17.04	Close and Stop trading after XX USD LOSE per day	<p><b>Note:</b> By default, -999,999 is very hard to reach (which is design not to use at 1st. If you want to specify and just want to use this losses, do change it according to the prop firm requirement.</p> <p><b>Note:</b> It is recommended not to put too close on this daily Lose USD limit, because when market very volatile, it may make the robot not have enough time to close at exactly USD losses (especially when you are using a bigger lot size), hence you accidentally violate the rule.</p> <p>Some of the prop firm require you NOT TO hold trade over the weekend. When is <b>TRUE</b>, EA will auto close all the trade when it is on Friday and after the End hour of trading. It will close it with a White 'X' indicating the robot has closed and stop trading already. It will close the trade regardless is in profit / lose. And the trade will not connected or re-entry for the next trading day (aka next monday).</p>	-999999	No								
17.05	Close all trades on Friday night	<p>Some of the prop firm require you NOT TO hold trade over the night. When is <b>TRUE</b>, EA will auto close all the trade when it is after the End hour of trading. It will close it with a White 'X' indicating the robot has closed and stop trading already. It will close the trade regardless is in profit / lose. And the trade will not connected or re-entry for the next trading day.</p>	FALSE	No								
17.06	Close all trades by the end of day	<p>Some of the prop firm require you NOT TO hold trade over the night. When is <b>TRUE</b>, EA will auto close all the trade when it is after the End hour of trading. It will close it with a White 'X' indicating the robot has closed and stop trading already. It will close the trade regardless is in profit / lose. And the trade will not connected or re-entry for the next trading day.</p>	FALSE	No								
18		Max Orders										
18.01	Max Positions Allowed (Total) - For Both (buy and sell)	Maximum both buy and sell trade that allow to open by this EA. If set to <1>, only 1 trade (either buy or sell) can enter at 1 time.	100	No								
18.02	Max Positions Allowed (Buy) - For Buy	Maximum buy trade (only) that allow to open	10	No								
18.03	Max Positions Allowed (Sell) - For Sell	Maximum sell trade (only) that allow to open	10	No								
19		Set Max Loss Limit										
19.01	Use Loss Limit control?	<p>Would you like to pause the EA when your account realised lose more than 50% (default, set below) from initial capital (since putting in the EA)?</p> <p>If you want to pause when your account already in big lose, set <b>TRUE</b>.</p>	FALSE	No								
19.02	Maximum allowable lose in %	<p>When your account balance drop below 50% (default) from initial starting capital (when putting in the EA), it will stop entering trading. This is a safety belt feature so at least 50% of your capital is safe.</p> <p><b>Note:</b> This is referring to starting capital when putting in the EA. If half-way you remove the EA / change TF etc, the "initial starting capital" will changed.</p>	50	No								
19.03	Use Drawdown (DD) Limit control?	<p>Would you like to pause the EA when your account is in drawdown (floating losses) more than 30% (default, set below) from current account balance?</p> <p>If you want to pause when account in huge drawdown, set <b>TRUE</b>.</p>	FALSE	No								
19.04	Max allowable drawdown in %	<p>When your account equity drop below 30% (default) from current account balance, it will stop entering trading. This is a safety belt feature so EA won't keep raking your account when is already in big drawdown.</p> <p><b>Note:</b> The formula of drawdown is &lt; ( AccountEquity / AccountBalance ) - 1 &gt;. Mean the drawdown is based on current equity over current balance.</p>	30	No								
20		OnTester Settings										
20.01	Ontester output type	<p>After backtesting, a dedicated "XPR" to measure the EA performance will output at Journal Tab, showing the value of OnTester. These value are the outputs of the following options.</p> <p><b>Max Equity Drawdown % from Initial Balance</b> = It showing the maximum drawdown in % based on initial starting capital. For eg, a starting capital of 10k USD profitted to 20k USD, 1 single trade lose back to 10k USD (with a net losing of 10k USD). In MT4 maximum DD it is calculated as (10k / 20k = 50% DD). But OnTester here is = (10k / "10k" = 100% DD). This signal that, at 1 single worst time in trading, we are potentially lose all (100%) the initial capital that we put in.</p> <p><b>Max ROI % from Initial Balance</b> = It calculated the maximum ROI in % the EA ever achieved in backtesting. For eg, An EA profit from 10k USD to 11k USD (10% growth), but after that continuously lose to 8k USD. By MT4 default your ROI is &lt;20% (losing), but your maximum ROI (OnTester) remain 10%. On backtesting journal, it will also output the total days needed to reach to your 10% ROI. This is helpful is you are just aiming to get as high profit as possible in short period of time.</p> <p><b>Profit Factor / Max Drawdown Percent</b> = A good EA performance matrix should consider both gain and losses. Here it calculate the ratio between Profit factor and Maximum DD in %. The higher the value, the smaller the DD and higher profit, mean it is potentially more consistent result.</p>	Max Equity Drawdown % from Initial Balance									
21		News Inputs										
21.01	Use News Filter?	<p>If <b>TRUE</b>, EA will automatically don't do trading when there is a market news. This will required to enable DLL feature on the EA to automatically scan the news data. The source is coming from <a href="http://www.fxnewsfactory.com">www.fxnewsfactory.com</a></p> <p>If <b>FALSE</b>, EA will just trade like the normal regardless of the news. In backtesting and optimisation, there is no source of News data for past history that can be use by the EA. Hence this feature will automatically FALSE.</p>	TRUE	No								

No.	Settings	Description	Default Value	Optimisation [1]	Suggested optimisation settings StartStepStop	Remark
						SrR = S&R • Support and Resistia DD = Drawdown Pts = Points TF = Timeframe BE = Breakeven TSL = Trailing Stop Loss
21.02	Stop Trading X Minutes before & after HGH Impact news	When there is a high impact news detected, it will stop do trading 60 minutes (default) before and after the news.	60	No		
21.03	Stop Trading X Minutes before & after Medium Impact news	When there is a medium impact news detected, it will stop do trading 30 minutes (default) before and after the news.	30	No		
21.04	Stop Trading X Minutes before & after Low Impact news	When there is a low impact news detected, it will stop do trading 15 minutes (default) before and after the news.	15	No		
21.05	Include High	Should the EA detect any high impact news? If TRUE, it will detect.	TRUE	No		
21.06	Include medium	Should the EA detect any medium impact news? If TRUE, it will detect. The reason of not detecting medium news is because generally EA do continue perform even there is a sudden change in the price movement.	FALSE	No		
21.07	Include low	Should the EA detect any low impact news? If TRUE, it will detect. The reason of not detecting medium news is because generally EA do continue perform even there is a sudden change in the price movement.	FALSE	No		
21.08	Include speaks	Should the EA detect any speaks news (can be any country representative / central bank)? If TRUE, it will detect. It will detect the time of occurrence, but EA will trade through here because generally speaks does not affect much on the market.	TRUE	No		
21.09	Include holidays	Should the EA detect any market holiday? If TRUE, it will detect. When country holiday, the market volatility is lower, hence your may need to re-adjust the risk	TRUE	No		
21.10	Show panel	Show the summary of news at left bottom of the chart (default set below)		No		
21.11	Panel side	Location of the panel for the summary of news	Left lower chart corner	No		
21.12	Show vertical lines	Draw vertical lines to indicate where the news will happen in future and in the past  By default, MT4 broker time is -6 ahead of server at forexfactory hence this input is to make adjustment and make sure the news time is aligned back to local time. However, the time may differ during Daylight Saving. Suppose the EA can automatic detect and make adjustment on Daylight Saving time (regardless which country you using the VPS for), this should be correct, but the settings is here to give flexibility of adjusting the time in case is wrongly calculated!	TRUE	No		
21.13	Chart time offset (in hours   +ve shift to left)	Note: To ensure the automatic adjust is operating correctly, it is suggested to place it on the weekday (Monday - Friday)  If TRUE, EA will display following info at the Top Right -- Strength ~ % price changes from previous day close price -- Bar Time ~ Minutes/Seconds left before forming a new candlestick -- Spread ~ Current spread of the market	-6	No		
21.14	Show Symbol mini-info (Strength / Bar Time / Spread)		FALSE	No		
21.15	Info font size	Font size of the panel. Can lower down if cannot fit a small screen PC.	8	No		
21.16	Minutes before first Alert (-1 mean no Alert)	If you want to be alert when news is coming, you can set eg. 10, so EA will alert you when news if 10 more minutes before it announced	-1	No		
21.17	Minutes before second Alert (-1 mean no Alert)	If you want to be alert when news is coming, you can set eg. 5, so EA will alert you when news if 5 more minutes before it announced This work as a 2nd "alarm" to notify you	-1	No		
21.18	PoppUp Alerts	If TRUE, EA shows a pop up alert with sound to notify you there is a news coming soon	FALSE	No		
21.19	Sound Alerts	If TRUE, EA play sound to notify you there is a news coming soon	TRUE	No		
21.20	Sound file name	The name of the sound file that played above. Available sound file is stored at your main MT4 application folder - Sounds	news.wav	No		
21.21	Send push notification	If TRUE, EA will send phone notation to your MT4 mobile to notify you there is a news coming soon	FALSE	No		
21.22	Show vertical lines	Draw vertical lines to indicate where the news will happen in future and in the past  By default, MT4 broker time is -6 ahead of server at forexfactory hence this input is to make adjustment and make sure the news time is aligned back to local time. However, the time may differ during Daylight Saving. Suppose the EA can automatic detect and make adjustment on Daylight Saving time (regardless which country you using the VPS for), this should be correct, but the settings is here to give flexibility of adjusting the time in case is wrongly calculated!  Note: To ensure the automatic adjust is operating correctly, it is suggested to place it on the weekday (Monday - Friday)	TRUE	No		
21.23	Chart time offset (in hours   +ve shift to left)		-6	No		
22		EA General Settings				
22.01	Magic No. - Auto Magic Number # (-1)	ID of the trading robot  By default -1 will automatically set for you.  But if you want to self-define own Magic No. (for easy tracking or to re-connect back to previous UP trades). You have to 1-Open a new chart, 2-re-attach UP, 3-specify your Magic No.	-1	No		
22.02	Add EA updates in the Expert & Journal Tab	Update the important information on EA trade progress.	TRUE	No		
22.03	Turn on Dashboard (Top Left)	If TRUE, all calculation and robot details will display at right (dashboard comment)  For ease of inspection, the EA will display: -- Net-Santa-Profit = From all past consecutive SL trades and current opening trade, the total net profit in USD -- DQ = Current drawdown based on today starting capital  If Entry Type is Single Same -- Buy_Profit = TRUE/FALSE Sell Profit = TRUE/FALSE = Showing whenever the previous buy / sell trade is in profit or not. If its in profit it show TRUE, otherwise FALSE  If Entry Type is Single Reverse -- Sell_Profit = Showing whenever is profitable for the past 7 days and inside bracket showing USD amount of profit / losing only for sell trades. -- Buy_Profit = Showing whenever is profitable for the past 7 days and inside bracket showing USD amount of profit / losing only for buy trades.	TRUE	No		
22.04	Show drawdown at bottom right		TRUE	No		
22.05	Track drawdown in backtester & Saved into Excel	If TRUE, EA will track the drawdown across time when doing backtesting	TRUE	No	BETA - Still Testing	
22.06	Plot place where AI learn to trade	If TRUE, EA will plot the price and level where it thinks is good to buy and sell (in the past 2800 candlestick) and label total 30 entry samples. This is just for you to visually see how the AI think should open the trade.  In AI Variables, all AI working together may seem a bit hard to understand how it work together. But in fact, here we summarised all the data and put into small indicator on the Top Right to visualise how the AI think.  If TRUE, DV7 will display the output of AI decision making at the top-right. Referring to the picture below. Note: You suppose need to get same "messy" histogram drawing like the sample below so DV7 can operate correctly.  > Red up and down verticle line • AI samples prediction of the past 400 candlesticks. > Yellow verticle line • Current AI prediction. If pointing up is good to buy, if pointing down, is good to sell. > Green horizontal line • The current AI prediction but drawn in horizontal scale so can visualize what is the confidence level now. At the left side it have yellow wording (XXX)(ZZZ)= YYYY XXXX is candlestick no. since it started. In the picture below, I mentioning candlestick no. 12, mean 12 candlestick has passed since you place DV7 into the chart. It will automatically reset the drawing every 400 candlestick. YYY is the value of Result on current candlestick (which can also cross reference in dashboard). Sometime the number is not the same, because some of the settings above limit DV7's checking entry conditions(AI) on every tick basic. ZZZ is the current confidence level, which is -0.50, which mean only have 50% on sell side) > Blue higher horizontal line = Buy Result limit where it will enter the buy trade. If the Yellow verticle line / Green Horizontal line crosses above the higher blue line it will buy. The number at higher-side of the rectangle (OOO) = YYYY XXX refer to confidence level, in picture it is 1.12 (112% confidence by AI) in order to enter a buy trade. YYY is the Buy Result threshold before entering buy trade. > Blue lower horizontal line = Sell Result limit where it will enter the sell trade. If the Yellow verticle line / Green Horizontal line crosses below the lower blue line it will sell. The number at lower-side of the rectangle (OOO) = YYYY XXX refer to confidence level, in picture it is 1.26 (126% confidence by AI) in order to enter a sell trade. YYY is the Sell Result threshold before entering sell trade. > White horizontal line = the mid-level between 2 blue line. When Green line is near White line, it is indicating AI have no clear clue on where the market is going to go next (0% confidence on both buy and sell side).	TRUE	No		
22.07	Plot histogram of AI entry decision boundry		TRUE	No		

[1] > Yes = Important settings to optimise

> Optional = Depend on desire your desire outcome, not nessary to optimise

>No = Not important to change

[2] This is the core of DV7 and maybe a bit hard to understand. Hence, take your time to read it. If you don't understand do let me (Eason) know, and lets figure out how to make this easier to understand.

[3] ONLY optimise if Auto SD is False

[4] ONLY optimise if Auto SD is False

[5] If give 1 as most profit, it mean instead of partial close, you should just close everything (1.0) when close signal come
